

Promax launches new VACUUM BOILER

Following the popularity of the ProFill Mini Boiler with many refill shops, Promax has designed and manufactured a higher capacity 'Midi Boiler.'

The Midi Boiler will clean up to 168 cartridges (HP 57 size) with the flexibility to clean both black and colour cartridges at the same time.

Vacuum boiling is widely recognised as the most effective way of cleaning sponge based cartridges.

5% off Spin Doctor in May

This small unit is designed to remove ALL air from the print head of ANY sponge based cartridge. Unlike other systems and methods the Spin Doctor will keep all ink inside the cartridge meaning no loss in page yield. Stringent testing and prototyping has confirmed improved sponge positioning and correct dispersal of ink. The Spin Doctor will process up to 4 cartridges during one short and automated cycle.

Customers who place an order for a Spin Doctor in May 2010 and quote "BKCMY" will receive a 5% discount of off the Spin Doctor AND any other items ordered at the same time!

Technical

Over the last year OCP have introduced a series of 'Process Optimised Inks.' These inks are reformulated versions of previous inks designed to match the improvements in colour and performance made by OEM manufacturers.

Extensive trials conducted in Germany and the UK have shown that the refiller can increase pass rates by up to 30% using the Process Optimised Inks whilst maintaining a fill volume equal to or higher than that of the OEM.

Our technical team would be more than happy to discuss these inks and any other technical queries with you.
